

1. I used JQuery on the homepage to make the page pop by making the header size increase and then decrease after a couple seconds. I used Aria labels on all websites to help people read the code better. I also have jaax requests receiving JSON data and parsing an xml file. I also have a couple imbedded videos on a couple pages
2. In some of the critiques i received it was basically with functionality, a couple pages weren't showing up on their end because I hadn't properly uploaded them to the server and then also the JSON data was not receiving on the github pages but it was on the webpages
3. I think my website has served its purpose because the goal was to introduce new coders to the most popular programming languages in the field. I wanted to introduce syntax but also give them information on some popular people in the world of programming. I also wanted to have some type of media, either a picture or embedded video, so the user is not just reading a bunch of text.
